

processes have lives and files have spaces. - UNIX.
UNIX OS = Process subsystem + File subsystem.

Process

Program: Set of instructions given to the computer,
executable file

process: program under execution

PE → MZ → terminal > readelf -h exe file
ELF → ? ELF

magic number

addr at entry fn

info of all sections

machine level
code

global & static
vars

"string const"

Sym (fn / var names)

- name, size, section, flags, addr

terminal > objdump -t exe file

.exe/.out (disk)

PE / ELF

loader

unit of
OS

(Ram)

process

PCB

info for
execution
of process

File

file is collection of data/info on storage device

file = contents (data) + info (metadata)

disk → data blocks

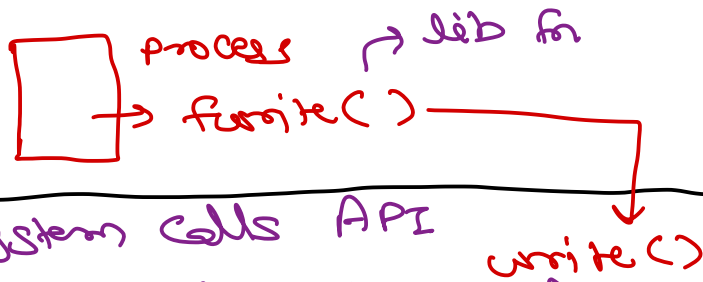

↓
FCB (inode)

- ① type
- ② size
- ③ permissions(mode)
- ④ user & group
- ⑤ timestamps

...

Hardware Protection

- Early operating systems work as resident monitors.
- Then OS start doing additional jobs like I/O, resource allocator, etc.
- In multiprogramming environment, one program could disturb other program in memory by corrupting its data.
- The programming errors are detected by hardware and conveyed to operating system via interrupt. OS should take appropriate action like terminating victim program.
- The following protection mechanisms are available:
 - ❑ Dual-Mode Operation
 - ❑ I/O Protection
 - ❑ Memory Protection
 - ❑ CPU Protection

device driver

syscalls are fns exposed by the kernel, so that user programs can access kernel functionality

UNIX : 64 sys calls.

Linux : > 300 sys calls.

Software interrupt

a special assembly instruction (arch dependent) → cause execution of ISR.

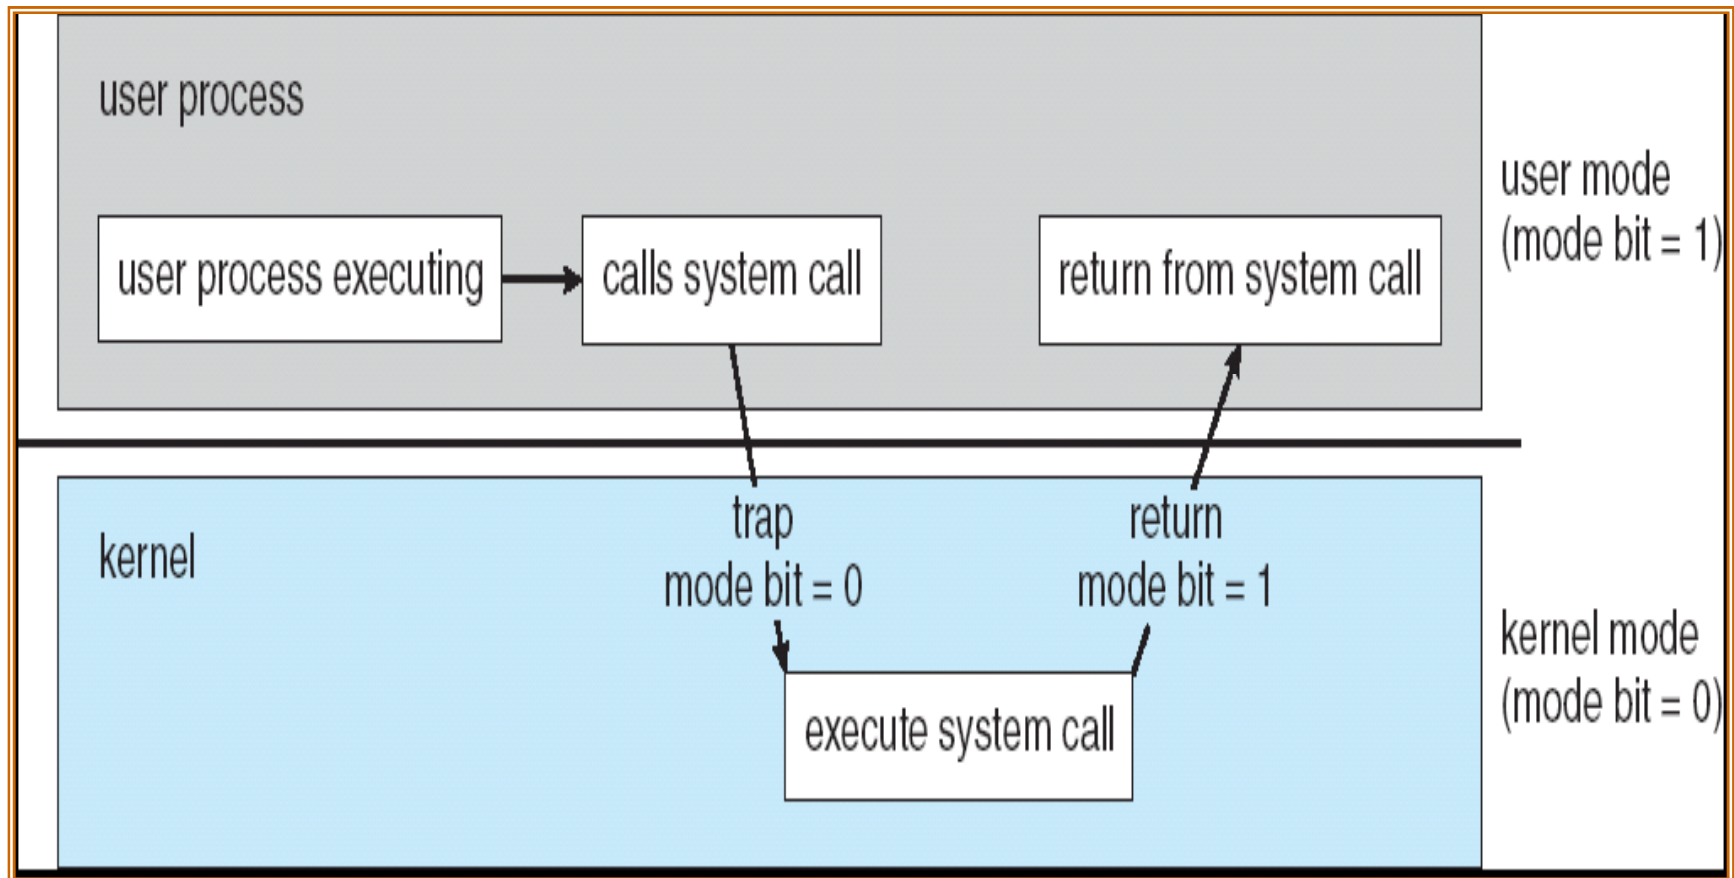

x86 : INT

ARM : SWI / SVC

Dual-Mode Operation

- Sharing system resources requires operating system to ensure that an incorrect program cannot cause other programs to execute incorrectly.
- Provide hardware support to differentiate between at least two modes of operations.
 - User mode – execution done on behalf of a user.
 - Monitor mode (also kernel mode or system mode) – execution done on behalf of operating system.
- Mode bit added to computer hardware to indicate the current mode: monitor (0) or user (1).
- When an interrupt or fault occurs hardware switches to monitor mode.

User mode and Kernel mode

Thank you!
